

# LLM Based QA Through Prompting

## Current Project Status:

We finished implementing the experimenting website. On the left side a user can place a pizza order to the pizza order chat bot (GPT 3.5). A second GPT 3.5 instance takes each response of the chat bot and checks if the given guidelines are followed. The guidelines should enforce ethical responses by the chat bot and can be updated in an interactive way.

## Current Goal:

Prompting, prompting, prompting... More specifically we are trying to break the current guidelines with user prompts and fix them by extending and changing the old guidelines. We want to see what a GPT powered guideline checker is capable of and what the weaknesses are.
